

FOR IMMEDIATE RELEASE:

TelePresence Tech expands to 23rd Country

May 11, 2009

Plano, Texas, USA. TelePresence Tech, LLC has shipped its first 3-D telepresence system into Austria, making Austria the 23rd country in which TelePresence Tech customers are using the company's breathtaking technology to cut travel costs, improve enterprise efficiency, and cut greenhouse gas emissions at the same time.

The new system was installed in Vienna, Austria by Teleportel Europe N.V., a Belgium-based telepresence specialist and channel partner for TelePresence Tech. Since its inception in 2001, Teleportel has been focusing exclusively on telepresence applications and since 2004, the company has served as the EMEA distribution and support arm for Plano-based TelePresence Tech.

TelePresence Tech systems overcome the inherent problem with standard video conference systems which use flat monitors and have exposed cameras placed at the top of the image area. These legacy systems cannot achieve aligned eye contact and this weakness totally disrupts the perception of presence. TelePresence Tech overcomes this obstacle with its granted US patent and international patent-pending designs for the videoconferencing image display system. The company's newest system displays life-size people appearing to be transmitted into the three dimensional setting of the room for real time communication with aligned eye contact.

Andrew W. Davis of Wainhouse Research says "As one of the pioneers in the telepresence field, TelePresence Tech has years of experience in creating a real sense of presence with their patented technology."

The TelePresence Tech solutions are currently being used by business, government, banking, and telemedicine specialists in Belgium, China, England, Germany, Holland, Hong Kong, Italy, Malaysia, Japan, Korea, Singapore, Taiwan, United States, Philippines, India, Indonesia, Norway, Denmark, Finland, Sweden, France, Poland and Austria.

About TelePresence Tech, LLC

TelePresence Tech, founded in 2004 by Duffie White has patented the invention of direct view configurations to generate a "sense of presence" with aligned eye contact with life-size people superimposed at a measurable distance in front of a physical background. The company has a full range of "3D TelePresence" solutions ranging from desktop units to full rooms with an 82" screen.
